# How does Microsoft 365 email archiving work?

- Microsoft 365 email archiving involves the automated transfer of email data from live servers to a dedicated archive environment. This process typically includes capturing every email sent and received across an organization, indexing the content for easy search and retrieval, and applying policies that govern the retention and deletion of emails based on legal and policy requirements.
- When emails are archived, they are often stored in an immutable format, meaning they cannot be altered once saved. This ensures the integrity of the data, which is crucial for legal and compliance reasons. The archive is designed to handle large volumes of data efficiently, making it easier for IT administrators to manage email storage without compromising server performance.
